# Axeom Pack 169 — from disconnected files to an owner’s first move

Prepared on November 7, 2026. Calculations use the brief’s October 6, 2026 snapshot. Personal details remain placeholders. This short writeup accompanies the full, source-linked evidence in analysis/.

## Findings and proof

30 real clients; Northstar is a payer, not a 31st client. Identity matching connects booking recipients to full emails, phones, shoot references and reviewed aliases. The June 9 message proves Northstar pays for Sunset and Meridian; neither is merged into the payer. Evergreen’s August 1 rebrand, Lena’s shared contact/booking evidence, and Tran’s email typo resolve duplicate identities. Similar Oak Cliff names remain separate. Every identity is listed in answers.json.

$11,050 confirmed overdue; $900 unapplied client credit; $2,040 completed but never billed. Explicit bank invoice references are allocated before unnamed receipts, then identity, amount, stated month and chronology resolve the remainder. Lena’s $900 bundle clears three August bills; Crown’s half-payment leaves $450. Sterling INV-1103 has no supporting receipt despite its “paid” flag. Six billing flags disagree with bank evidence. Keystone’s five receipts exceed its four invoices by $900. Unbilled work is Bloom B101/B125 ($270 each) and Silverleaf B111 ($1,500). Void INV-1150 is excluded. Full allocations and service-match rules are exported.

The conservation check is $152,810 nonvoid invoices - $126,490 receipts + $900 unapplied = $27,220 balances: $11,050 overdue + $14,670 not yet due + a $1,500 cancellation dispute. Joy claims canceled B146 was prepaid, while supplied receipts explicitly settle other services. INV-1135 is held out of collection, not asserted paid or refundable. Literal overdue including it would be $12,550. Northstar’s $900 September remainder is certain at payer level; its exact invoice allocation is provisional.

44 instruction-capture gaps among 118 audited initial requests. Original messages are matched to client, video title and shoot context, then compared with board notes. Two voice-note and both Instagram requests were missed. Monthly gaps increase from 2/15 in May to 4/17 in June, 10/23 in July and 15/30 in August. Of the gaps, 39 involve Zara-assigned videos after her June 2 start. This indicates a handoff/onboarding/QA problem; it does not establish personal blame or final-video defects. Three unnamed requests remain ambiguous. Two postapproval scope changes and Price’s client-wide naming rule are tracked separately.

Save Price Insurance first. Victor’s September 3 naming instruction is repeated September 10; Sofia asks whether they continue September 29 and follows up October 2. Contact her before the October 9 shoot, audit the naming, and agree an accountable repair plan. Then review cash and repair request handoffs. The operational reply queue has 23 genuine items: 22 nonspam blank replies plus L098’s future-dated reply; the raw 26 blanks are preserved.

Meta ad leads observed contribution: $24,000.40. First known lead source receives completed booking revenue plus completed-month retainer invoices, less modeled studio cost and all recorded editing hours, including revisions/WIP. Website contributes $21,371.80; referrals $18,510.60. Missing acquisition spend, overhead, shoot labor and lifetime outcomes prevent net-profit or ROI claims.

## Working system, cost and limits

The mobile Owner Desk opens with three decisions: save Price, review cash, close missing instructions. Client pages connect every source. Multi-file uploads validate atomically, upsert stable IDs, deduplicate messages, and recalculate everything. Unknown references, repeated titles and novel requests remain reviewable. Approval creates a local task or updates board notes; nothing is sent automatically.

It is buildless HTML/CSS/JavaScript on Sites, with browser storage and no application server or paid runtime API calls. Code, deterministic processing and API usage cost $0/month. Sites hosting uses the available account entitlement; its allowance is not exposed here, so unlimited free hosting is not claimed. There is no cross-device database, inbox sync, direct sending or automatic billing. New identity/semantic arrangements may require review. Tests cover financial invariants, audited mappings and unseen uploads; 58 phone/desktop browser checks passed on the published Jev version. This is browser emulation, not a physical-phone usability study.

## Jev and the next two weeks

Jev routes messages and flags edit/continuation concerns. Direct TypeSafe access failed authentication and offers no free credits. OpenCode's documented jev-1.13-free worked on the supplied zero-balance account: a real probe and the 40/40 reference cases all reported zero cost and free billing. A separate run covered all 192 inbound messages at $0. Frozen benchmark: 37/40 routing (92.5%), 36/40 edit detection (90%), 40/40 continuation risk (only three risk-positive cases); all three fields agree in 35/40. Five disagreements remain attached to their sources. This selected development sample does not establish a general production accuracy guarantee. A second blinded review found one ambiguous spam label before predictions. No benchmark relabeling or prompt retuning inflated the score. The app shows recorded native probabilities and requires review; new messages use rules until fresh Jev results are imported.

Week 1: verify cancellation/payment ambiguities, validate all inferred matches, evaluate a separate holdout set, and interview the owner about the first-screen decisions. Week 2: add shared storage with appropriate access, durable request/version history, confirmed brand-rule checks before delivery, and a measured reply SLA. Add outbound integrations only with explicit approval and an audit trail. The applicant must replace identity placeholders and record the supplied 7–8 minute guide; no recording or transcript is invented.
